Men and women tend to have similar brain activity during an orgasm, despite the different emotions and behaviors displayed by both genders. Image courtesy of Shutterstock.

Researchers from Stanford University in California recently showed that in

So here's what we do know: The PFC, however, showed more activation when touches and pelvic squeezes were imagined compared with those that were real. This is a hormone and neurotransmitter produced by the hypothalamus.

Immediately after, I follow the same cycle with Kegele exercises—brief squeezes. I am about to stimulate myself to orgasm while an fMRI scanner tracks the blood flow in my brain.
